

Project specification

February 16, 2022

Stage 1

The program will be limited to only search for the (RTX 30)-graphiccard series, meaning RTX 3060, 3070 and 3080. Each card type has a subgenera of all models, ex. ASUS ROG Strix GeForce RTX 3070 Ti Gaming OC 8GB, would be one model. Everything till now will be predefined alternatives selected from a menu.

Based on the choices made before, the program will scrape "komplett.se", "inet.se" and "mediamarkt.se". It will then return a pricetag and how many in stock from every page.

Stage 2

If everything works in stage 1, next step is to reduce hardcoded options. The program will now return all existing models, based on selected series.

Stage 3

The user will be able to search for a product and the program will return all models of said product, followed by pricetags and supply. The pages will still be predefined.
